

High speed mink weight

The mink weight consists of two specialized tubes, which is made in durable material. It can at the same time be used for toys. The weight has two load cells made in stainless steel. The weight is easy to mount in the cage. It is sold in sets of 8 weights which includes one load cell indicator with 8 outlets. It can be connected from 1 to 8 weights on the load cell indicator.

The weight makes about 600.000 weighings per day per cage, and the weight measurements are recorded with a precision of down to 5 grams. It collects data several times daily for each mink and cage. The data is wireless transmitted to the server where the client and the feed center can log on to the website to see the data. You can also see the data on your smartphone.

It is possible to see the weighings after the morning feeding and again after the feeding in the afternoon. If the mink loses weight it will trigger an alarm and red numbers will be displayed. It decreases the possibility of diarrhoea or other disease and is detected early and the mink can be saved.

For every cage there is a graph showing weight data for the two minks in the cage. The low curve is the female and the high curve is the male.
